Education

Kazan National Research Technical University (KNRTU-KAI)
Bachelor in Informatics and Computer Engineering (09.03.01)
Kazan • Expected Graduation: 2030

First-year IT student passionate about InfoSec, CTFs, and backend development. Looking for an entry-level/intern position to grow in Application Security or Infrastructure. Fast learner with hands-on experience in basic web vulnerabilities, memory forensics, and Linux administration.

Skills

Security and CTF
Web Exploitation , Memory Forensics, OSINT.

Infrastructure & Linux
Linux administration, Self-hosting, Proxy configurations (Hiddify, Xray).

Languages
Python , Go , Bash

Tools
Burp Suite, Wireshark, Git, Docker, Belkasoft X, Volatility 3

Projects

Self-Hosted Home Lab & Infrastructure — Linux, Networking, Security

- **Engineered** a private, self-hosted infrastructure on headless Debian servers to learn Linux administration and network hardening.
- **Deployed** and manage key services including a private Matrix server and a remote NAS, hardening the environment with custom firewall rules (iptables) and secure proxy configurations.

HelloNN — Python, NumPy, Math

- **Built** a functional Neural Network entirely in NumPy to deeply understand the underlying mathematics of ML, deliberately bypassing high-level libraries like TensorFlow/PyTorch.
- **Manually implemented** core components including forward/backward propagation, activation functions (Leaky ReLU, Softmax), and an Adam Optimizer.

Go-C2 — GoLang, Cybersec, Networking

- **Architected** a foundational Command & Control (C2) framework to research attacker TTPs and low-level networking.
- **Developed** a concurrent, multi-agent TeamServer, leveraging Go's concurrency primitives (mutexes) for thread-safe agent registration and management.
- **Engineered** a custom beaconing agent for system reconnaissance with a clear roadmap for RCE, OPSEC jitter, and traffic obfuscation.
